

$x \in X, y \in Y, w \in W, e \in E; Y_{\perp} = Y \cup \{\perp\}, H \subseteq Y^X, T \subseteq (X \rightarrow X) \times (Y \rightarrow Y); \chi_t = (X, Y_{\perp}, W, E, H, T, P, D, \geq, A, \text{Def}, C, \Delta, \varepsilon, \Lambda), \Lambda: 2^Y \rightarrow Y_{\perp}.$

$$K_t = \Gamma_{\chi_t}(M_t, x_t, e_{\leq t}) \subseteq H_t$$

$$\text{Stable}_{\chi}(h) \Leftrightarrow [\exists x A(h, x, e)] \wedge \forall x, \forall (\sigma, \tau) \in T: [A(h, x, e) \wedge A(h, \sigma x, e)] \Rightarrow [P(h, x, \sigma x, e) \wedge \Delta(h(\sigma x), \tau(h(x))) \leq \varepsilon(\sigma, \tau, x)]$$

$R_t = \text{Max}_{\geq^D_{\chi_t}} \{h \in K_t : \text{Stable}_{\chi_t}(h)\}$, where $\geq^D_{\chi}$ is a declared robust preorder and Max keeps all nondominated elements

$$U_t = \{h \in R_t : A_{\chi_t}(h, x_t, e_{\leq t}) \wedge \neg \text{Def}_{\chi_t}(h, x_t, e_{\leq t})\}$$

$O_t = \{h(x_t) : h \in U_t\}; a_t = \Lambda_{\chi_t}(O_t) \in Y_{\perp}$, with $\Lambda_{\chi_t}(O) = \perp$ whenever declared resolution is unavailable

$$e_{t+1} = C_{\chi_t}(x_t, a_t, w_{t+1}); (M_{t+1}, \chi_{t+1}) = \text{Rev}(M_t, \chi_t, K_t, e_{t+1})$$

Common sense is a robust, context-stable default: use it while applicable and undefeated, preserve unresolved rivals,
abstain rather than invent a winner, let reality revise it, and retain it while evidence still supports it.

STABILITY

Lawful changes may leave an output unchanged or transform it predictably. Exact invariance is the special case $\tau = \text{id}$ and $\varepsilon = 0$. Stability is tested only where the candidate remains applicable.

ROBUST CHOICE

The robust preorder need not be complete. Max preserves incomparable co-maximal candidates. Scalar utility is only one lawful way to induce the order.

DEFEASIBLE USE

Def is a local evidence-sensitive veto, not library erasure. Λ may resolve only by a declared rule; unresolved conflict, empty choice, or resolver failure returns $\perp$.

REVISION

Γ may generate or refine candidates. Rev may update memory or frame prospectively from evidence, preserving provenance and still-supported prior structure.

LEGAL FRAME RULES

1. Every frame component used to admit, rank, defeat, resolve, or test a candidate is fixed before its result is observed, or revised prospectively from new evidence.

2. T and ε encode task-relevant equivalence; ε is independently calibrated, never a rescue knob.

3. D is declared and $\geq^D$ is a preorder. Robustness cannot be claimed against disturbances invented after failure.

4. Court is outcome-responsive and author-independent. Evidence used to tune or revise cannot also prove that revision without fresh or adaptivity-corrected evidence.

5. Defeat is local. A resolver cannot manufacture an ordering; unresolved rivals produce $\perp$, not a fake winner.

6. Nonuse alone does not erase rare supported rules, and failure of Γ to generate a candidate is not evidence that none exists.
