

$$\begin{aligned} h_{t+1} &= \rho_{\chi}(h_t, C_{\chi}(\text{Use}_{\chi}(h_t, x_t)), u_t) \quad \text{with} \quad h_t \in \text{Rob}(\chi) \\ \text{Rob}(\chi) &= \arg \max_{h \in \text{Inv}(\chi)} \min_{\delta \in D} E_x[I(h; x, \delta)] \\ \text{Inv}(\chi) &= \{ h \in H \mid \forall x \in X, \forall \sigma \in \Sigma : \Delta(h(x), h(\sigma(x))) \leq \varepsilon \wedge P(h, x) \} \end{aligned}$$

Common sense is a robust, context-stable default that may be locally defeated, loses to external evidence, and survives only when later situations keep recruiting it.

FRAME χ

$\chi = (X, Y, H, \Sigma, P, I, D, <, C, \rho, \Delta, \varepsilon)$.
The frame supplies the domain; the schema supplies the discipline.

DEFEASIBLE USE

Apply the default at x only while no applicable undefeated $h' <_x h$ outranks it. Otherwise switch or abstain.

COURT C

Score outcomes with a signal independent of the author's preference. The world may defeat the candidate.

RETAIN ρ

Update from traces: outcomes plus later recruitment u_t . Unused or losing habits decay; repeatedly recruited winners persist.

LEGAL FRAME RULES

ONE SCHEMA | MANY LEGAL FRAMES | ONE UPDATE

Σ is chosen independently of the candidate h .

$D \neq \emptyset$; otherwise robustness is fake.

C is author-independent empirical feedback.

Defeat $<_x$ is local, not global erasure.

ρ reads traces and reuse, not self-description.
